Late-breaking readout roundtable 8

Stephen Salloway, MD*
Professor of Psychiatry and Human Behavior and Professor of Neurology, Warren Alpert Medical School, Brown University, Providence, RI, USA; Chief of Neurology and Director, Memory and Aging Program, Butler Hospital, Providence, RI, USA

Oskar Hansson MD, PhD*
Professor of Neurology, Department of Clinical Sciences, Malmö, Lund University Senior Consultant of Neurology, Memory Clinic, Skåne University Hospital Lund, Sweden

Jeffrey Cummings MD, ScD
Research Professor, Department of Brain Health UNLV Director, Chambers-Grundy Center for Transformative Neuroscience at UNLV Joy Chambers-Grundy Professor of Brain Science (an endowed professorship) Las Vegas, Nevada, USA

Gil Rabinovici MD
Edward Fein and Pearl Landrith Endowed Professor in Memory and Aging (UCSF) Professor, Neurology UCSF Weill Institute for Neurosciences San Francisco, California, USA

* Stephen Salloway and Oskar Hansson are also authors on this presentation: Dose- and time-dependent changes in plasma p-tau181 in patients treated with aducanumab in the ENGAGE and EMERGE trials
None of the participants in this panel discussion have received any compensation from Biogen or Eisai in connection with their participation in this event. As always, the views expressed by all panelists are their own.
Disclosures

Authors/Panel Members

- SS receives research support for conduct of clinical trials from Lilly, Biogen, Genentech, Avid, Roche, Eisai and Novartis. He was a site PI for the PRIME, ENGAGE, Clarity and Trailblazer 1 trials. He is a co-chair of the investigator steering committee for the aducanumab phase 3 program and he is the Project Arm Leader for gantenerumab in the DIAN-TU study. He is a consultant to Lilly, Biogen, Roche, Genentech, Eisai, Bolden, Amylyx, NovoNordisk, Prothena, Ono and Alnylam. He owns no stocks or equity in any pharmaceutical company and has no patents or royalties.
- OH has acquired research support (for the institution) from AVID Radiopharmaceuticals, Biogen, Eli Lilly, Eisai, GE Healthcare, Pfizer, and Roche. In the past 2 years, he has received consultancy/speaker fees from AC Immune, Alzpath, Biogen, Cerveau and Roche.

Authors

- RR, TC, LN, KKM, GD, PH, CCV, and SBH are employees and shareholders of Biogen.

Panel members

- GR receives research funding from Avid Radiopharmaceuticals, GE Healthcare, Life Molecular Imaging, Genentech. In the past 3 years, he has earned consulting fees from Eisai, GE Healthcare, Genentech, Johnson & Johnson and Roche.
- JC has provided consultation to Acadia, Alkahest, Alzheon, AriBio, Avanir, Axsome, Behren Therapeutics, Biogen, Cassava, Cerecin, Cortexyme, EIP Pharma, Eisai, Foresight, GemVax, Genentech, Green Valley, Grifols, Janssen, Karuna, Merck, Novo Nordisk, Ono, Otsuka, ReMYND, Resverlogix, Roche, Signant Health, Sunovion, Suven, and United Neuroscience pharmaceutical and assessment companies. He has stock options in ADAMAS, AnnovisBio, MedAvante, and BiOasis. He owns the copyright of the Neuropsychiatric Inventory.

Writing and editorial support for the preparation of this presentation was provided by MediTech Media (Atlanta, USA): funding was provided by Biogen.

14\textsuperscript{th} Clinical Trials on Alzheimer’s Disease (CTAD) conference

November 9-12, 2021
Plasma p-tau is a novel, promising blood-based biomarker for Alzheimer’s disease

Plasma p-tau levels are increased in AD

Aβ+ Cognitively unimpaired N=244
Aβ+ Mild cognitive impairment N=86
Aβ+ Cognitively unimpaired N=77
Aβ+ Mild cognitive impairment N=62
Aβ+ Alzheimer disease dementia N=121
Parkinson’s disease
Parkinson’s disease dementia
Multiple system atrophy
Progressive supranuclear palsy
Corticobasal syndrome
Behavioral variant frontotemporal dementia
Primary progressive aphasia
Vascular dementia

Approximative ordering of Alzheimer’s disease biomarker changes during the disease course

Biomarker abnormality

Plasma P-tau217 (pg/ml)

Detection threshold

Restricted MTL tau pathology
Cortical Aβ pathology starts
Increased phosphorylation and secretion of soluble tau
Widespread cortical PHF tau pathology and acceleration of neurodegeneration

Soluble p-tau levels may mediate the relationship between amyloid aggregates and tau aggregates

\[ c = 0.55 \quad (P<0.0001) \]

\[ c - c' = 0.41 \quad (77\%), \quad (P<0.0001) \]

\[ a = 0.63 \quad (P<0.0001) \]

\[ b = 0.66 \quad (P<0.0001) \]

\[ c' = 0.14 \quad (P=0.09) \]

The strongest mediation was seen for total tangle density when removing tangles in the medial temporal lobe (77% mediation; the direct effect of Aβ plaques on tangles became non-significant)

Figure adapted from Mattsson-Carlsgren N, et al. *EMBO Mol Med.* 2021;13:e14022\(^1\)

Aβ, amyloid beta; p-tau, phosphorylated tau.
Soluble p-tau levels may mediate the relationship between amyloid aggregates and tau aggregates

- Amyloid-induced tau aggregation and spread (and consequent cognitive decline) might be driven by increases in soluble p-tau levels\(^1,2\)
- Then, removing amyloid aggregates should result in reduced p-tau levels…
- …followed by slowing of accumulation of tau aggregates and clinical decline

Study design: 18-month, randomised, double-blind, placebo-controlled, parallel-group studies designed to assess the efficacy, safety, pharmacokinetics, and pharmacodynamics of aducanumab

Study population: Early Alzheimer’s disease (at MCI and mild Alzheimer’s disease stages)

Primary endpoint: Change from baseline in CDR-SB score at 18 months

Secondary endpoints: MMSE, ADAS-Cog 13, ADCS-ADL-MCI

Biomarker endpoints: amyloid PET, tau PET, CSF disease-related biomarkers, plasma disease-related biomarkers

Global studies: 3285 patients at 348 sites in 20 countries
Amyloid PET showed dose- and time-dependent reduction in β-amyloid pathology with aducanumab

Previously reported at ADPD 2021
Aducanumab reduced CSF biomarkers of tau pathology and neurodegeneration at Week 78\textsuperscript{a}

Previously reported at ADPD 2021

In EMERGE and ENGAGE, aducanumab also reduced tau levels in areas of the brain that have tau pathology at early stages of Alzheimer’s disease (tau PET pooled data)

- Dose-dependent reduction in brain tau levels in the frontal, temporal and medial temporal composite brain regions

\textsuperscript{a} Significant reduction for EMERGE and numerical for ENGAGE: CSF modified analysis population (patients with both baseline and post-baseline CSF assessments). *p<0.05, **p<0.01, ***p<0.001 compared with placebo (nominal). Values were based on an ANCOVA model at Week 78, fitted with change from baseline as the dependent variable, and with categorical treatment, baseline biomarker value, baseline age, and laboratory ApoE \textepsilon 4 status (carrier and non-carrier) as the independent variables. \textalpha, amyloid beta; ANCOVA, analysis of covariance; ApoE, apolipoprotein E; CSF, cerebrospinal fluid; p-tau, pg/ml, picograms per milliliter; phosphorylated tau; SE, standard error; t-tau, total tau.
Effect of aducanumab treatment on plasma $p$-tau$^{181}$

Objective

To investigate the effect of aducanumab treatment on plasma $p$-tau$^{181}$ levels using data from the Phase 3 aducanumab trials—EMERGE and ENGAGE

- Participants with plasma samples at baseline and Week 78 were assessed
- A total of 6929 plasma samples from EMERGE and ENGAGE subjects were analyzed using the Quanterix Simoa $p$-tau$^{181}$ Advantage V2 kit at Frontage Laboratories’ (Exton, PA) CLIA laboratory
- The inter-assay CV was 6.49–8.15% and the intra-assay CV was 8.30–9.21%

*\(p<0.05\), **\(p<0.01\), ***\(p<0.001\) compared with placebo (nominal). MMRM with change from baseline as the dependent variable and with fixed effects of treatment group, categorical visit, treatment-by-visit interaction, baseline value, baseline value by visit interaction, baseline age, and ApoE status. ApoE, apolipoprotein E; MMRM, mixed model for repeated measures; pg/ml, picograms per milliliter; p-tau, phosphorylated tau; SE, standard error.
Change in plasma p-tau^{181} is correlated with change in amyloid PET SUVR at Week 78

Scatterplots of change from baseline plasma p-tau^{181} vs change from baseline florbetapir amyloid PET composite SUVR (reference region = cerebellum) at Week 78

R = 0.38, p < 0.0001

R = 0.42, p < 0.0001

R: Spearman correlation adjusted for baseline p-tau, baseline amyloid PET, and age. Correlations calculated based on all arms. PET, positron emission tomography; pg/ml, picograms per milliliter; p-tau, phosphorylated tau; SUVR, standardized uptake value ratio.
Reduction in plasma p-tau$^{181}$ was greater in aducanumab-treated subjects who had an amyloid PET SUVR ≤1.10 at Week 78.

Assessed in pooled low and high dose aducanumab-treated groups. A SUVR of 1.10 is a threshold reported to discriminate between positive and negative florbetapir amyloid PET.\(^1\) PET, positron emission tomography; pg/ml, picograms per milliliter; p-tau, phosphorylated tau; SUVR, standardized uptake value ratio. \(^1\)Joshi AD, et al. J Nucl Med. 2015;56:1736–1741.
Greater reduction in plasma p-tau\textsuperscript{181} is associated with less clinical decline across all four clinical measures in both studies.

Correlations are partial Spearman correlations assessed in pooled low and high dose aducanumab-treated groups, adjusting for baseline p-tau, baseline clinical endpoint, and age. ADAS-Cog 13, Alzheimer's Disease Assessment Scale–Cognitive Subscale; ADCS-ADL-MCI, Alzheimer's Disease Cooperative Study–Activities of Daily Living Inventory (mild cognitive impairment version); CDR-SB, Clinical Dementia Rating–Sum of Boxes; MMSE, Mini-Mental State Examination; p-tau, phosphorylated tau.
Evidence from a large dataset (~7,000 plasma samples from 1815 patients with early Alzheimer’s disease) demonstrated that aducanumab produces a significant dose- and time-dependent reduction in plasma p-tau$^{181}$ consistently in both EMERGE and ENGAGE.

The treatment effect of aducanumab on plasma p-tau$^{181}$ was associated with lowering of amyloid PET SUVR and reduced cognitive and functional decline.

- This is consistent with the hypothesized relationship among the underlying pathologies of Alzheimer’s disease.

These findings demonstrated that modification of biomarkers fundamental to the underlying disease pathology was associated with statistically significant slowing of clinical decline as measured by CDR-SB, MMSE, ADAS-Cog13, and ADCS-ADL-MCI.

ADAS-Cog 13, Alzheimer's Disease Assessment Scale–Cognitive Subscale; ADCS-ADL-MCI, Alzheimer's Disease Cooperative Study–Activities of Daily Living Inventory (mild cognitive impairment version); CDR-SB, Clinical Dementia Rating–Sum of Boxes; MMSE, Mini-Mental State Examination; PET, positron emission tomography; p-tau, phosphorylated tau; SUVR, standardized uptake value ratio.
We thank the Alzheimer’s disease community, all the patients and their family members participating in the aducanumab studies, as well as the investigators and their staff conducting these studies.
